

WINGS MEDIAA

VOL. 01 — THE BLUEPRINT

Website Research, Brand Direction & Design System.

A field study of the world’s most alive agency websites — distilled into a motion-led, ultra-premium design system for Wings Mediaa.

PREPARED FOR	Wings Mediaa — Founders & Leadership
DISCIPLINE	Brand · Web · Motion · Interaction · UX
VIBE TARGET	Bold & Energetic (Active Theory / Resn / Buck territory)
AUDIENCE	Mixed — SMB through Enterprise (India + Global)
STATUS	Strategic blueprint, ready for design → dev handoff

Contents

00 — EXECUTIVE DIRECTION

The premise.

Wings Mediaa is not selling ‘a website.’ It is selling the proof that we can move attention. The website is the first ad we will ever run for ourselves. Every pixel, every easing curve, every scroll-pinned section must answer one question: do we look like the studio you would trust with your brand’s most-watched 15 seconds? This document is the answer.

If a client lands on the homepage and doesn’t move their cursor for five seconds, the design has failed. If they scroll, hover, scroll-back, and screen-record — we have already pitched ourselves.

The strategic move

Indian agencies tend to lead with logos, awards and ‘services we offer.’ The world’s best agency websites — Active Theory, Resn, Buck, Obys, Watson DG, Hello Monday, 14islands — lead with feel. They make you watch a website the way you watch a film opening. Wings Mediaa’s positioning gap is to be the first Indian house that competes on craft of feel, not breadth of services. That is the unfair advantage this document architects.

What the website needs to do

- Convert a CMO in 90 seconds and a college-founder in 5 minutes — same site, different surface.
- Make the work the hero, not the agency — case studies are the product.
- Communicate motion mastery in the first three seconds without a video play button.
- Earn the ‘how is this loading so fast’ reflex — craft is visible in performance, not just visuals.
- Hold up next to Active Theory, Buck, Locomotive on a side-by-side tab comparison.

PART 01 — FIELD NOTES

How the world’s best agency sites actually behave.

This section is not a curated showcase. It is field notes — written for a senior designer who has to make decisions tomorrow. Each card breaks the site into seven observable signals (hero, motion, type, color, cursor, transitions, work) plus a takeaway: what Wings Mediaa should steal, adapt or reject.

All sites were observed between Q4 2025 and Q2 2026. Hero treatments, especially WebGL scenes, evolve quickly; the patterns below are the load-bearing structure, not the cosmetics.

Active Theory activetheory.net

HERO TREATMENT	Full-bleed WebGL stage with an ambient generative scene; brand mark stays as a fixed bug, copy comes in as a stack-typed phrase reveal.
MOTION SIGNATURE	Scroll is the storyteller — entire homepage behaves like a single timeline. Sections are pinned and scrubbed; copy and 3D scenes move in lockstep with scroll velocity.
TYPOGRAPHY	Mono sans (Suisse / Söhne territory) for everything except moments of huge display set. Type is small most of the time, then explodes for one big statement.
COLOR	Near-black canvas, a single saturated accent that changes per case study, generous use of high-contrast brand color borrowed from the case in view.
CURSOR	Custom small dot cursor that scales into a labeled pill on interactive elements ('VIEW', 'PLAY', 'NEXT').
PAGE TRANSITIONS	Color flood transition into case studies — entire viewport floods with the project’s primary color before the case loads.
WORK SHOWCASE	Case studies are designed like film title sequences. Big typography, paced edits, occasional WebGL set-pieces.

TAKEAWAY *The whole homepage as a single cinematic timeline is the most copy-worthy structural idea. Wings Mediaa should ship a homepage that reads like one continuous reel.*

Resn (resn.global) resn.global

HERO TREATMENT	Either a heavy WebGL hero or a single arresting still that masks into the brand wordmark; never 'explainer paragraph + hero image.'
MOTION SIGNATURE	Heavy on shader-based image displacement — imagery distorts on cursor hover, on scroll velocity, and in transition. Imagery is treated as material, not photograph.
TYPOGRAPHY	Heavy sans display contrasted with neo-grotesque body. Occasional drop of italic serif for editorial moments.
COLOR	Confident dark mode by default; a single hot accent (often electric red or sodium yellow). Color is never decorative — it carries meaning.
CURSOR	Larger cursor blob with mix-blend-mode difference; turns into a play triangle over video tiles.
PAGE TRANSITIONS	Curtain reveal between routes — the new page is masked in from one edge, often timed to the click position of the link.
WORK SHOWCASE	Vertical, full-screen card stacks. Each card behaves like a poster.

TAKEAWAY *Image-as-material thinking. Wings Mediaa's case images should never feel like static plates — displacement, parallax, scroll-coupled scale.*

Buck (buck.co) buck.co

HERO TREATMENT	Looping reel of micro-clips edited to a constant rhythm; the hero IS a showreel, not a typography poster.
MOTION SIGNATURE	Auto-scrolling editorial rhythm: small choreographed entries on every section. Nothing is static for more than a beat.
TYPOGRAPHY	Editorial. Big condensed display headline + clean grotesque body. Type carries personality through size jumps, not weight gymnastics.
COLOR	Off-white canvas, deep ink, one accent that shifts per project. Feels more print magazine than agency website.
CURSOR	Pointer with hover-state labels; conservative — lets the content carry the load.
PAGE TRANSITIONS	Soft fade-up between routes; the visual continuity is maintained by holding shared elements across nav clicks.
WORK SHOWCASE	Big poster-led case study covers with elastic hover scale; horizontal scroll for additional shots inside the case.

TAKEAWAY *The work IS the hero. The agency name takes a small fixed slot. Wings Mediaa should fight every instinct to over-brand the chrome.*

Obys Agency obys.agency

HERO TREATMENT	Loud kinetic typography hero — wordmark and tagline animate with weight scrubs and stagger reveals; physics-driven ‘falling letters’ preloader.
MOTION SIGNATURE	Cannon.js + Three.js physics for the preloader. GSAP everywhere else. Hover states have a satisfying ‘bounce’ with elastic ease.
TYPOGRAPHY	Big personality — a custom geometric display face is the brand. Used at extreme sizes (200px+ on desktop).
COLOR	High-contrast — cream + ink + one electric accent. Rarely more than three colors at once.
CURSOR	Magnetic cursor + label pill. The cursor itself becomes UI: it tells you what will happen if you click.
PAGE TRANSITIONS	Slide-in with color block transition; the new page rides in on top of a flood layer.
WORK SHOWCASE	Long-scroll case studies with pinned text columns and scrubbing imagery.

TAKEAWAY *The preloader is the first creative act. Wings Mediaa’s preloader should be a 1.2s mini-performance, not a spinner.*

Watson DG watsondg.com

HERO TREATMENT	Editorial hero — a single strong claim set in large display type, paired with a high-quality photographic still or short loop.
MOTION SIGNATURE	Restrained but deliberate — slow ease-outs, large parallax distances on imagery, generous breathing room.
TYPOGRAPHY	Pairs an editorial serif with a clean modern sans. Always with very tight tracking on the display.
COLOR	Warm neutral palette — ivory, ink, one earthy accent. Reads premium-brand-consultancy.
CURSOR	Subtle dot cursor with a quiet label expansion.
PAGE TRANSITIONS	Curtain reveal with cross-fade; the navigation persists across routes.

WORK SHOWCASE	Each case study is a long-form magazine spread; full-bleed photography, pull-quotes, scroll-pinned section titles.
----------------------	--

TAKEAWAY *If Wings Mediaa wants to reach enterprise buyers, the case study layer must read this calmly even while the homepage screams.*

Hello Monday hellomonday.com

HERO TREATMENT	Big confident headline + ambient color field background; sometimes a soft generative gradient mesh.
MOTION SIGNATURE	Mid-tempo — scroll-snapping between full-bleed cards, gentle scale and opacity transitions, occasional WebGL set-piece.
TYPOGRAPHY	Display geometric + neo-grotesque body. Headline sizes are huge but the leading is generous — reads like a manifesto.
COLOR	Saturated brand color paired with cream. Confident, never edgy.
CURSOR	Soft dot cursor; transforms into a label on links.
PAGE TRANSITIONS	Scale-down + cross-fade between routes; preserves a sense of ‘rooms’ in the site.
WORK SHOWCASE	Project cards that expand to full-screen on click — the card IS the case page during the transition.

TAKEAWAY *The expand-card transition is one of the most premium feeling navigations on the web. Wings Mediaa case index should ship this pattern.*

Locomotive locomotive.ca

HERO TREATMENT	Strong typographic hero with a single hero image masked by scroll. Native demo of their own smooth-scroll library.
MOTION SIGNATURE	Inertia-led smooth scrolling — the page itself has weight. Scroll inputs are filtered through a lerp, so motion always feels expensive.
TYPOGRAPHY	Editorial neo-grotesque (Suisse Int’l / PP Neue Montreal feel) + accent display moments.
COLOR	Cream background, ink type, restrained accent on hover only. Almost luxe-print.
CURSOR	Custom cursor that morphs from dot to large ‘VIEW’ pill on case tiles.
PAGE TRANSITIONS	Mask-reveal route changes; the new route literally slides up under the old.

WORK SHOWCASE	Mosaic of case tiles with varying aspect ratios; hovering tilts them slightly with perspective.
----------------------	---

TAKEAWAY *Smooth scroll is now table-stakes. Wings Mediaa must ship Lenis (or equivalent) on day one.*

Immersive Garden immersive-g.com

HERO TREATMENT	Full-screen WebGL with a hero phrase set in massive display type, masked into the canvas.
MOTION SIGNATURE	Scroll feels like a camera dolly through 3D space — not just ‘page scroll.’ Every section has a 3D moment.
TYPOGRAPHY	Tight display sans + ultra-condensed accent. Type is always huge or tiny, never medium.
COLOR	Inky black + electric accent (often a yellow or cyan). Never more than two colors in view.
CURSOR	Reactive blob cursor with shader displacement.
PAGE TRANSITIONS	Hard color cut between routes — black flash, then in.
WORK SHOWCASE	Cinematic case studies with 3D scene tours.

TAKEAWAY *If we can afford one WebGL set-piece, Immersive Garden’s ‘camera-dolly scroll’ is the highest-value move.*

14islands 14islands.com

HERO TREATMENT	Generative gradient or particle hero, big quiet headline, almost no chrome.
MOTION SIGNATURE	Slow and confident — long ease-out durations, low-frequency motion, lots of breathing.
TYPOGRAPHY	Single elegant sans for everything. Restraint as a flex.
COLOR	Pastel-tinted dark mode — the background is almost-black with a hue.
CURSOR	Minimal pointer; one elegant cursor label.
PAGE TRANSITIONS	Cross-fade between routes; restraint over spectacle.
WORK SHOWCASE	Case studies as scroll-pinned scenes — each a short film with a section title.

TAKEAWAY *Restraint is also bold. Wings Mediaa’s About page should borrow this register — it lets the work pages scream by contrast.*

North Kingdom northkingdom.com

HERO TREATMENT	Filmic hero — high-bitrate loop with type overlaid in mix-blend-mode difference.
MOTION SIGNATURE	Cinematic pacing; the cursor is always a slight tease of ‘something will happen.’
TYPOGRAPHY	Pairs editorial serif with grotesque sans. Type sizes are deliberately classical.
COLOR	Photographic palettes — the imagery dictates the color.
CURSOR	Standard pointer with hover affordances; less custom-cursor than peers.
PAGE TRANSITIONS	Cross-fade with held shared title.
WORK SHOWCASE	Each case is a film case: hero loop, type cards, project metadata.

TAKEAWAY *If Wings Mediaa’s biggest deliverable is video, this is the case-study template to copy.*

OFF+BRAND — Lando Norris (Awwwards Site of the Year 2025)

HERO TREATMENT	Bold lime green type stamped over a rotating 3D helmet; the hero is a single object on a single color.
MOTION SIGNATURE	Cinematic scroll-driven sequence; the helmet stays anchored and the world moves around it. Webflow + WebGL + Rive.
TYPOGRAPHY	Big condensed display + clean sans body. Color does the screaming, not type weight.
COLOR	Lime / acid green + ink + white. Two-and-a-half color palette — maximum restraint with one weapon.
CURSOR	Subtle pointer with state changes; the spectacle is the scene, not the cursor.
PAGE TRANSITIONS	Section-to-section dolly; the site reads as one continuous scene change.
WORK SHOWCASE	Single-subject site — not directly applicable, but the discipline is the lesson.

TAKEAWAY *Brutal color confidence + one hero subject + scene-driven scroll. Wings Mediaa should similarly commit to a single dominant accent.*

Dept Agency deptagency.com

HERO TREATMENT	Modular tile grid; the hero is a confident mission statement, not a video.
MOTION SIGNATURE	Steady, predictable, restrained motion — this is a holding-company site, not a creative studio site.
TYPOGRAPHY	Strict neo-grotesque + serif accents.
COLOR	Bright signature green + black + white. Brand-led, not work-led.
CURSOR	Standard pointer; subtle hover lifts.
PAGE TRANSITIONS	Standard fade between routes.
WORK SHOWCASE	Big case logos + metric callouts; performance-led storytelling.

TAKEAWAY *If Wings Mediaa wants enterprise credibility, learn from Dept's metric callouts — numbers next to logos still convert CMOs.*

Ueno (archive feel) ueno.co (archive references)

HERO TREATMENT	Confident headline + a single curated still or short loop; never busy.
MOTION SIGNATURE	Subtle stagger reveals, restrained scroll motion, polished microinteractions.
TYPOGRAPHY	Editorial serif moments inside otherwise clean sans system.
COLOR	Cream + ink + one accent per case.
CURSOR	Small dot cursor with quiet label.
PAGE TRANSITIONS	Fade with shared element holds.
WORK SHOWCASE	Long-form editorial cases.

TAKEAWAY *Editorial register is timeless. Wings Mediaa should keep at least one register that ages well — not everything has to scream 2026.*

Obys / Bien / monopo ('studio band') obys.agency · bien.studio · monopo.us

HERO TREATMENT	Loud kinetic-type or art-direction-led hero; rarely a video loop, almost never a stock photo.
MOTION SIGNATURE	GSAP-led; signature is the timing — always one beat slower than the user expects, with a confident overshoot.
TYPOGRAPHY	Custom display + utilitarian mono. Type is a logo every time.
COLOR	Two-color discipline with one rebel accent.

CURSOR	Magnetic cursor or contextual cursor label — always custom.
PAGE TRANSITIONS	Color flood or slide-up reveal.
WORK SHOWCASE	Each case is treated as a different art-direction sandbox — the wrapper is the only constant.

TAKEAWAY *Wings Mediaa's case studies should not all look the same. The chrome stays consistent; the case interior changes art direction.*

Lusion lusion.co

HERO TREATMENT	Heavy WebGL scenes — fluid, particle, shader-driven.
MOTION SIGNATURE	Lusion is the high end of 3D-on-web; scenes are interactive, performant, and feel hand-crafted.
TYPOGRAPHY	Clean sans — the type is intentionally quiet because the 3D is loud.
COLOR	Dark canvas + emissive scene colors.
CURSOR	Custom cursors that interact with the WebGL scene.
PAGE TRANSITIONS	Scene-driven, not page-driven.
WORK SHOWCASE	Each case is a guided walkthrough of a 3D world.

TAKEAWAY *Lusion is our north star for any one hero set-piece we commission. Not for every section.*

Cross-site synthesis

Eight motion patterns that repeat at the top

- Single-timeline homepage — the entire page reads like one scroll-scrubbed reel, not a stack of cards.
- Inertial / smooth scroll — Lenis is the default; raw native scroll instantly feels cheap by comparison.
- Magnetic / labeled cursor — the cursor is UI, not just a pointer; it tells you what is interactive.
- Kinetic typography — type reveals char-by-char or by word stagger, never as a single block.
- Image displacement on hover — case thumbnails distort, scale, or tilt to confirm interactivity.

- Color-flood route transitions — a single brand color washes the viewport before the next page paints.
- Card-to-page expand — the clicked case tile geometrically expands into the case page (View Transitions API or animated layout).
- Section pinning — large case sections pin while their inner content scrubs through.

Five layout patterns worth copying

- Asymmetric ‘broken’ grids — the design system supports a strict grid but every section uses a slightly different cut.
- Horizontal scroll inside a vertical page — case logos, services, or testimonials slide horizontally as the page scrolls vertically.
- Marquee strips — client logo or service strips animate left-to-right at constant velocity; near-zero cost, high feel.
- Pinned-text + scrubbing-imagery — the headline holds while the imagery cycles.
- Two-up case grid with elastic hover scale — hovering a case tile lifts its neighbor slightly down; the grid breathes.

Color palette themes (Q1–Q2 2026)

Premium dark mode is no longer a toggle — it is the brand. The 2026 dominant near-black is #09090B / #0A0A0F, a zinc-tinted black with the warmth necessary to not look medical. Accents have moved away from cyan-magenta gradients back toward single-saturated weapons: electric crimson, sodium yellow, acid lime. Mesh gradients have returned as background lighting (not decoration). Grain overlays at 4-6% opacity are now table-stakes — they remove the cheap-CSS feel that flat dark mode has.

Typography trends (Q1–Q2 2026)

Pangram Pangram’s PP Neue Montreal remains the default ‘premium agency’ sans; Söhne (Klim) and Suisse Int’l are its luxury cousins. Migra and PP Editorial New are the editorial serifs of choice, used for italic display moments. IBM Plex Mono and PP Supply Mono are now the standard ‘system’ cousins for metadata, version stamps, and code-feel UI. Variable fonts are used not for novelty but for weight scrubs on scroll — a headline gains optical weight as it enters view, then settles.

Stack signals you can read from the network tab

- Next.js 15+ or Astro 4+ is the default render layer; SPA full-Webflow is now the exception, not the rule, at the top.
- GSAP 3.12+ with ScrollTrigger is the universal animation engine. Framer Motion / Motion is used in component-heavy product surfaces.

- Lenis 1.x (Darkroom Engineering) is the universal smooth-scroll layer; react-lenis on React stacks.
- Three.js with react-three-fiber + Drei for any non-trivial 3D. Pure vanilla three for WebGL one-shot hero scenes.
- Rive replaces Lottie for any motion that needs to be lighter, interactive, or state-driven.
- Vercel + Sanity / Prismic / Strapi for the CMS spine. Webflow remains common for small studios but is now considered ‘below’ the elite tier.

PART 02 — 2026 MOTION & INTERACTION

What ‘modern’ actually means right now.

Motion is no longer decoration; it is now the load-bearing layer of premium web. ‘Smooth animations’ is a useless phrase. The patterns below are the actual moves the top 100 sites are making, with the timing values and libraries that ship them.

01 — Scroll mechanics

Smooth-scroll is universal. The serious sites couple scroll to a global timeline (GSAP ScrollTrigger) and use scroll position to drive scenes, not just trigger them. Three patterns dominate:

- Pin & scrub — a section pins for the duration of a scene; inner content advances by scroll progress, not by time.
- Velocity-coupled motion — typography wobble, image displacement, or particle drag is multiplied by scroll velocity, so fast scrolling produces more drama.
- Section-scroll snapping — large landing sections snap into place using ScrollSmoother / Lenis snap; navigation feels like a card-deck.

Avoid when: the site is content-heavy and information density matters; readers need predictable jump-to-section behavior. Always honor prefers-reduced-motion by falling back to native scroll.

02 — Cursor systems

The cursor is the most touched UI element on the page. Premium sites use it as a status indicator:

- Dot + halo — a small dot follows perfectly; a soft halo lags behind on a spring (stiffness 200, damping 30).
- Magnetic snap — over CTAs the cursor and the button visually attract; the button moves toward the cursor by up to 18px.
- Contextual label pill — over interactive media the cursor swallows a label (‘VIEW’, ‘PLAY’, ‘DRAG’) with a scale up to 56–80px.
- Mix-blend-mode difference — the cursor blends with whatever is under it; reads as a single brand element no matter the background.
- Video-preview-on-hover — over a case tile the cursor expands into a tiny looping case preview.

Implementation pattern: a fixed-position element with `translate3d` updated on a `rAF` loop, smoothed with a `lerp` at 0.12–0.2. Hide on touch devices. Hide for `prefers-reduced-motion`.

03 — Kinetic typography

Type is now the medium, not the label. Eight moves dominate:

- Char-by-char reveal on scroll-into-view, staggered 20–40ms per character; use `SplitText` (GSAP) or a manual `span-split`.
- Word stagger with `translateY` clip-mask — each word rises 24–40px into a hidden mask; reads more confident than character reveal for long headlines.
- Variable font weight scrub — the headline gains weight from 400 to 800 as it enters the viewport; use `font-variation-settings` with GSAP.
- Marquee strips — client names or services run at constant velocity; pause on hover; reverse on scroll-up if you want extra drama.
- Hover-displace — individual letters jitter on cursor proximity using a shader or per-letter transform.
- Text-on-path — service names curl around a circle or wave; reads as branding moment, not content.
- Mix-blend-mode text over video — the headline punches through the loop; works only on high-contrast loops.
- Italic accent — a single italicized word inside a sans headline carries the whole tone.

04 — Hero patterns that replaced the boring video hero

- Single-subject 3D — one rotating, scroll-coupled object on a single color (the 2025 SOTY did this with a helmet).
- Generative gradient mesh — a slow-moving WebGL mesh acts as ambient lighting; copy sits over it.
- Kinetic statement hero — no image at all; the brand promise is the hero, set in massive type that animates on entry.
- Shader-displaced still — a single still photograph is processed through a displacement shader; the cursor distorts it locally.
- Letter-mask video — a video plays inside the letters of the wordmark; high impact, low file budget.
- Card-deck poster hero — case-study posters fan into the hero like a dealt hand.

05 — Page transitions

- Color flood — the destination route's primary color floods the viewport, then the page paints under it. 700–1000ms.
- Curtain reveal — a colored panel slides over the old route from one edge, then exits from the opposite edge revealing the new route.
- Shared-element morph — the clicked card morphs into the case page hero. Use View Transitions API (Chrome / now Safari TP) with FLIP fallback.
- Expand-to-fullscreen — the clicked tile scales to 100vw before the case page mounts.
- Hard cut with hold — the navigation chrome persists; only the content area swaps. 200ms cross-fade; reads as 'app-like' confidence.

06 — Microinteractions

- Magnetic buttons — transform: translate by 0.18 of cursor offset over a 120px proximity radius.
- Elastic hover scale — transform: scale(1.04) with overshoot, cubic-bezier(0.34, 1.56, 0.64, 1).
- Count-up numbers — ROAS, CTR, ROI numbers count from 0 to their final value on scroll-into-view; use a 1.2s expo.out.
- Sticky CTA with progress bar — a slim progress bar at the bottom of the viewport tracks scroll depth.
- Mask-clipped image reveals — images enter from a clip-path that animates from 0% to 100%; 800ms expo.out is the agency standard.
- Ripple on click — a soft circular ripple radiates from the click point on primary CTAs.

07 — 3D / WebGL status

Realism is out. Stylized, art-directed 3D is the move. Shader-driven materials (fresnel, noise, dispersion) read more premium than 'PBR realistic.' r3f + Drei is the React stack; vanilla Three.js for one-shot landing scenes. Performance budget: hero scene must hit 60fps on mid-range mobile and not exceed 4MB total asset weight (compressed).

08 — Color & surface trends

Near-black canvases (#09090B / #0A0A0F) with one saturated accent dominate. Mesh gradients have returned but as lighting (multiply / screen blend) rather than decoration. Grain overlays at 4–6% opacity are universal. Glassmorphism survives only as a quiet UI moment (nav, modal), never as a hero treatment.

09 — Type pairings trending

- PP Neue Montreal (display + body) + PP Editorial New Italic (display accent) — the safest premium pairing of 2026.
- Söhne (Klim) + Söhne Mono — if budget allows a license.
- Aeonik + Migra Italic — the bolder energetic pairing; Migra carries the wildness.
- Free alternatives — General Sans + Bricolage Grotesque + JetBrains Mono.

10 — Easing & timing actually used

Stop using ease-in-out for everything. The agency standard is asymmetric easing — fast departure, slow arrival.

- Expo out — cubic-bezier(0.16, 1, 0.3, 1). Universal for entrances. 600–900ms.
- Quart out — cubic-bezier(0.25, 1, 0.5, 1). For hover scale and elastic snaps.
- Power3 out (GSAP) — the GSAP default; nearly identical to expo-quart blend.
- Spring — stiffness 220, damping 26 for cursors and magnetic states (Framer Motion / react-spring).
- Slow ease — cubic-bezier(0.65, 0, 0.35, 1) for large hero moves and scroll-pinned scrubs.

Typical durations: hover 200ms, microinteraction 280–350ms, entrance reveal 600–900ms, hero set-piece 1.0–1.6s, page transition 700–1000ms.

11 — Library and stack

RENDER LAYER	Next.js 15 (App Router) on Vercel; Astro 4 for content-heavy variants
ANIMATION ENGINE	GSAP 3.12+ with ScrollTrigger, SplitText, CustomEase, Flip
SMOOTH SCROLL	Lenis 1.x via lenis/react
3D / WEBGL	Three.js + @react-three/fiber + @react-three/drei; Theatre.js for sequencing
COMPONENT MOTION	Motion (Framer) for component states; GSAP for global scroll motion
LIGHTER MOTION	Rive for state-driven illustration; Lottie for legacy needs only
IMAGERY	next/image, AVIF first JPG fallback; loading=eager only above the fold
CMS	Sanity (preferred), Prismic or Strapi as alternatives

ANALYTICS	PostHog + Plausible; GA4 only if mandated by client tracking
FORMS	Formspree / Resend / custom Edge functions; CAPTCHA-less for low-spam contexts

12 — Accessibility & performance budgets

- All entrance motion must respect prefers-reduced-motion — fall back to a 1-frame opacity transition.
- Cursor systems must hide on touch devices and reduced motion; the keyboard tab ring must remain visible at all times.
- LCP < 2.0s on 4G mid-range mobile; hero must render with critical CSS inlined.
- CLS budget: < 0.05; reserve space for all asynchronously loaded media.
- INP < 200ms even with motion engine running.
- Total page weight cap: 1.2MB JS + 1.5MB media for non-3D pages; 2.5MB for hero 3D pages.

PART 03 — WINGS MEDIAA PRINCIPLES

Twelve commitments we will not compromise on.

01. The site is a film, not a brochure.

Every section is a scene; the scroll is the cut. We compose the homepage like an edit, not a stack.

02. The cursor is a brand element.

We ship a custom cursor on day one. It tells the user what is interactive without copy ever having to.

03. Motion is purposeful, never decorative.

If an animation does not reveal hierarchy, signal interactivity, or carry an emotion, it does not ship.

04. Restraint is also bold.

Two colors, two type families, one accent. We earn the right to scream by being quiet 80% of the time.

05. Performance is craft.

60fps on a Pixel 6 is non-negotiable. The site that loads in 1.4s feels more expensive than the one with prettier transitions.

06. The work is the hero.

Case studies are the product. The home page exists to launch them; the about page exists to back them up.

07. Accessibility is the floor.

Keyboard reachable, screen-reader sane, prefers-reduced-motion honored. No exceptions.

08. Type is the personality.

We never confuse 'brand voice' with the logo. The personality is in the typeface choice and how it moves.

09. Color is a weapon, not a wardrobe.

One accent does the work of ten. We do not roll out a rainbow.

10. The case interior is an art-direction sandbox.

The chrome of the site is consistent. The inside of each case study is allowed to look different — that is the proof of range.

11. We are mobile-first even though we look desktop-grand.

Every hero, every cursor moment, every transition has a designed mobile twin. We never 'degrade' to mobile — we author it.

12. The site is alive.

Even idle, something is breathing — a gradient drift, a marquee, a slow camera dolly. The site never feels frozen.

PART 04 — BRAND POSITIONING

Who Wings Mediaa is on the page.

Brand promise

Wings Mediaa is the studio you call when the brief says ‘make it move.’ We grow brands by making attention move — in feeds, in funnels, and on the page itself.

Tone of voice

- Confident, not boastful — we show, we don’t shout.
- Concrete, not abstract — we lead with the result, then the method.
- Warm, not formal — we use ‘we’ and ‘you,’ never ‘the agency’ or ‘the client.’
- Sharp, never cute — we earn lines, we don’t pad them.

Audience matrix

SMB FOUNDER (INDIA)	Wants results clarity — ‘Will this site convert?’ We answer with three numbers above the fold.
D2C FOUNDER	Wants craft + numbers — case studies must show creative AND ROAS.
MID-MARKET MARKETING LEAD	Wants process + reliability — our ‘how we work’ page closes them.
ENTERPRISE CMO	Wants senior trust — leadership bios, named clients, and a calmer registers in deeper pages.

Messaging spine

- Headline H1 — a single confident promise (max 7 words).
- Sub — one sentence that names the verticals and the result.
- Proof — three numbers, hand-set in display type, with the brand they belong to.
- Work — the rest of the site.

PART 05 — DESIGN SYSTEM

The Wings Mediaa system.

Color system

The Wings Mediaa palette is built on the 2026 premium dark stack — zinc-tinted near-black, off-white, and a single saturated weapon. A secondary accent (acid lime) exists exclusively for one-of-one moments (the 404, the easter-egg state, the loud testimonial).

INK (PRIMARY)	#0A0A0F — zinc-warmed near-black. Default canvas in dark mode, default type in light mode.
BONE (SURFACE)	#F4F4F1 — warm off-white. Default canvas in light mode.
CRIMSON (ACCENT)	#FF3D2E — electric crimson. The single brand weapon. Used for CTA, link hover, brand mark accent, scroll-bar.
LIME (SECONDARY)	#E6FF3C — acid lime. Reserved — used on the 404, the testimonial pull-quote, the 'we built this in 12 weeks' metric line.
MUTE (SUBTLE)	#8A8A95 — cool gray. Captions, metadata, mono labels.
HAIRLINE (BORDER)	#1F1F26 on dark, #D7D7D2 on light — 1px hairlines only.
TINT GLOW	#FF3D2E @ 12% alpha radial — ambient lighting moments behind the hero.

Semantic colors (success, warn, error) inherit the accent system: success uses lime; warn uses crimson at 60%; error uses crimson at 100%. We do not introduce blue, green, or yellow as semantic colors — the system stays disciplined.

Typography system

Type carries the entire personality of the brand. We pair PP Neue Montreal (display + body) with PP Editorial New Italic (one-off display accents) and JetBrains Mono (metadata, mono UI). If a budget-free fallback is required, the swap is General Sans + Bricolage Grotesque + JetBrains Mono. Every type token is defined in fluid clamp() so display sizes scale across breakpoints.

DISPLAY XXL	PP Neue Montreal Bold · clamp(64px, 9.2vw, 168px) · lh 0.95 · tracking -0.04em · hero only
DISPLAY XL	PP Neue Montreal Bold · clamp(48px, 6vw, 112px) · lh 1.0 · tracking -0.03em · section opens

DISPLAY L	PP Neue Montreal Medium · clamp(36px, 4.5vw, 72px) · lh 1.05 · tracking -0.02em · sub-section
DISPLAY ITALIC (ACCENT)	PP Editorial New Ultralight Italic · same scales · used for a single italicized word inside a sans headline
EYEBROW	PP Neue Montreal Medium · 14px · uppercase · tracking 0.18em · the small labels above section titles
BODY L	PP Neue Montreal Regular · 20–22px · lh 1.5 · max-width 60ch
BODY M	PP Neue Montreal Regular · 16–18px · lh 1.55
BODY S / CAPTION	PP Neue Montreal Regular · 14px · lh 1.5 · mute color
MONO / METADATA	JetBrains Mono Regular · 12–14px · uppercase · tracking 0.06em · used for case-study numbers, version stamps, scroll counters

Grid & spacing

We ship a 12-column desktop grid with 24px gutter on a 1440 reference; collapses to 6-column at 768 and 4-column at 480. Spacing is a tee-shirt scale built on 4px base: xxs 4 / xs 8 / sm 12 / md 16 / lg 24 / xl 40 / xxl 64 / xxxl 96 / hero 160. Section vertical rhythm is 120–200px on desktop, 64–96px on mobile. We use the ‘broken grid’ principle: each section is allowed to break the strict grid for an art-direction moment, as long as the navigation, footer, and case index conform.

Motion principles

Motion in the Wings Mediaa system answers three questions: where am I, what just changed, and what can I do next. We codify motion as a small token set.

ENTRANCE	translateY(24–40px) + opacity 0→1 · 600–900ms · cubic-bezier(0.16, 1, 0.3, 1) · stagger 60ms
HOVER LIFT	scale 1.02–1.04 + soft shadow · 280ms · cubic-bezier(0.34, 1.56, 0.64, 1)
MAGNETIC	translate by 0.18 of cursor offset over a 120px radius · spring stiffness 220 damping 26
MASK REVEAL	clip-path inset 100% 0 → 0 · 800ms · cubic-bezier(0.16, 1, 0.3, 1)
MARQUEE	linear constant velocity 60–100px/s · pause on hover · reverse on scroll-up if dramatic

SCROLL PIN SCRUB	ScrollTrigger pin, scrub: 0.6 · inner scenes mapped to 0–1 timeline
PAGE TRANSITION	color-flood with accent · 700ms in, 600ms out · cubic-bezier(0.65, 0, 0.35, 1)
CURSOR LERP	0.16 · dot 8px · halo 36px · label pill 56–80px
IDLE AMBIENT	background gradient drift 30s loop · grain layer 4% opacity · marquee strips 1–2 per page

Cursor system

- Default state — 8px solid Ink dot + 36px lerping Ink halo at 20% alpha.
- Hover-link — dot fades, halo scales to 56px, accent border, copy inside reads ‘VIEW’ / ‘READ’ / ‘PLAY’ per context.
- Hover-CTA — magnetic attraction; cursor and button visually couple; halo turns crimson.
- Hover-media — cursor swallows tiny case preview at 80x80; lerps with scroll velocity drag.
- Hover-drag (carousel) — halo becomes a horizontal pill with ← → arrows.
- Touch / reduced motion — cursor hidden, focus rings amplified.

Layout patterns / sections we ship

- Hero — cinematic kinetic-statement or single-subject 3D with anchored brand.
- Marquee proof bar — client logos in mono caps, constant-velocity scroll, pause on hover.
- Service stack — each service as a pin-and-scrub section; case thumbnails to the right.
- Selected work — two-up grid with elastic hover and ‘expand-to-fullscreen’ navigation.
- Numbers row — three big count-up metrics in display type, mono labels beneath.
- Process band — horizontal-scroll inside vertical page; 4–6 steps.
- Voices — testimonial cards with portrait, large pull-quote in italic accent.
- Manifesto — a single big statement set as Display XXL, scroll-revealed char-by-char.
- CTA close — oversized brand mark + magnetic primary CTA + secondary calendar link.
- Footer — site map, social, email, location, time-of-day clock that updates live.

Component library overview

BUTTONS	Primary (filled crimson), Secondary (outlined ink), Ghost (text + magnetic underline). All magnetic on hover.
----------------	---

NAV	Fixed top, 64px bar; thin hairline; logo left, condensed menu right; mobile is full-screen overlay with staggered link reveal.
CASE TILE	16:10 media, mono caption row, hover scale 1.04, label-pill on the cursor.
METRIC BLOCK	Mono eyebrow, big count-up number in Display L, single-line context below.
PULL-QUOTE	Italic editorial accent, attribution mono row with role, company, year.
FORM FIELDS	Underline-only, no rounded boxes; floating mono label.
LOADER	1.0–1.2s wordmark assembly — ‘W·I·N·G·S·M·E·D·I·A·A’ with falling letters physics tease (Rive or 2D canvas).
CURSOR	Two-element (dot + halo) with five states; mix-blend-mode difference.

Iconography & imagery

- Icons — mono line, 1.5px stroke, square caps; we do not use generic icon kits.
- Imagery — prefer commissioned video over stock; if stock is needed, treat it through a Wings Mediaa grade (duotone, grain, slight crush).
- Photography of team — single light source, off-white seamless, never ‘fun team’ group shots.
- Case media — 16:10 or 9:16 for vertical reels; never 1:1 except in carousels.

Voice in microcopy

- Buttons — verb + object: ‘See the work’, ‘Start a project’, ‘Read the case’. Never ‘Click here.’
- Empty states — admit it, then route them: ‘Nothing here yet. Try the work index.’
- Errors — calm, never cute: ‘That email didn’t send. Try again or write to hello@wingsmediaa.com.’
- Loaders — we don’t apologize for loading. We perform.

PART 06 — PAGE ARCHITECTURE

The site, page by page.

Homepage

The homepage is one continuous scroll-scrubbed reel composed of nine beats:

- Beat 1 — The Opening. Loader assembles into the wordmark; wordmark dissolves into the hero statement.
- Beat 2 — The Promise. Display XXL kinetic statement in three lines; italic accent on the verb.
- Beat 3 — The Proof Bar. Marquee of client logos in mono caps; pause on hover.
- Beat 4 — Selected Work. Two-up grid with elastic hover and expand-to-fullscreen click target.
- Beat 5 — Numbers. Three count-up metrics that animate on scroll-into-view.
- Beat 6 — What We Do. Pin-and-scrub service stack; each service has a 6-second mini scene.
- Beat 7 — How We Work. Horizontal-scroll inside vertical page; four steps.
- Beat 8 — Voices. Two testimonial pull-quotes in italic accent with portrait.
- Beat 9 — CTA Close. Oversized brand mark, magnetic primary CTA, secondary calendar link.

Work index

A mosaic of project tiles with varying aspect ratios. Filter chips (Brand / D2C / Performance / Content) animate the grid with a Flip layout transition. Hovering a tile scales it 1.04 and shifts its neighbors; clicking a tile expand-to-fullscreens into the case page.

Case study (single)

Each case is treated as a film: cover hero (loop or hero still), client metadata in mono, the brief in italic editorial accent, the work in scroll-scrubbed sections, the numbers in a count-up row, the credits in mono, the 'next case' magnetic CTA. The interior art direction is allowed to deviate from the chrome — the wrapper is the constant, the case is the variable.

Services

Five service pages — Performance Marketing, Social & Content, Branding, Web & Motion, SEO/AEO. Each follows the same template: a hero claim, a pinned demo (we make the demo the proof), a deliverable list, three case cards, a CTA. We never produce a ‘service brochure’ page.

About

Calmeest register on the site — editorial, slower scroll, leadership portraits, a single big manifesto pull, location/clock, careers link.

Insights / Blog

Long-form articles set in a generous editorial column. Mono metadata rail. Cover hero with author + read time. We do not run a tag-heavy index — a single chronological list with featured pins.

Contact

Two paths: a project-brief form (with budget + timeline + service chips, designed to feel like a calm intake) and a Calendly-style direct slot. Email + WhatsApp + location with a live local-time clock. The form fields are underline-only, the submit button is magnetic, the success state is a one-line ‘We’ll be in your inbox in 24 hours’ set in Display L.

Footer

Five-column: brand mark, sitemap, services, social, newsletter. Live clock for Mumbai/Delhi local time. A small ‘what we are listening to’ line that updates monthly. The footer is the last reveal — always anchored, always alive.

PART 07 — HOMEPAGE STORYBOARD

Frame by frame.

This is the storyboard a designer can hand to a developer. Each beat lists what is on screen, what moves, and the timing values.

Beat 0 — Preloader (0–1.2s)

Background: Ink. Foreground: 'W·I·N·G·S · M·E·D·I·A·A' assembled letter-by-letter with a Cannon.js-style fall, then settles into the wordmark and slides up to the nav slot.

Beat 1 — Hero statement (entry 0.4s after preloader)

Display XXL three-line statement: 'We make brands / move — in feeds, / in funnels, / on screen.' The word 'move' is set in PP Editorial New Italic and rendered in Crimson. Each line is masked from below and rises 40px with a 0.08s stagger; total reveal 1.1s. Ambient gradient drift behind. Grain layer at 4%.

Beat 2 — Sub-anchor (1.5s after hero)

A single sentence sub appears under the hero: 'A motion-led studio for D2C, brand and performance.' Mono mark to the left ticks '01 / 09.' Scroll affordance dots pulse at the bottom.

Beat 3 — Proof marquee (on scroll, +1 section)

Client wordmarks in mono caps run constant-velocity right-to-left. Pause on hover, reverse on scroll-up. Hairline above and below; ink canvas with crimson 1px tick markers every 200px to give the strip rhythm.

Beat 4 — Selected work (on scroll)

Two-up grid. Tiles enter mask-reveal at 800ms expo-out, staggered 120ms. Hovering a tile shifts the neighbor 8px down and scales the hovered tile 1.04. Cursor halo turns into a 'VIEW' pill in crimson.

Beat 5 — Numbers (pin & scrub, 60vh duration)

Three metrics pinned for 1 scroll-screen. Numbers count from 0 to their target over the pinned duration (scrub bound to ScrollTrigger 0–1). Mono labels read 'ROAS / FOLLOWERS / IMPRESSIONS.' The right edge holds a tall thin progress line that grows as the scrub advances.

Beat 6 — Services (pin & scrub stack, 200vh)

Five services. The headline is pinned; the right column scrolls through service descriptions, each accompanied by a 4-second visual scene (looping micro-clip, generated gradient, or 3D set-piece). The headline word changes per service via a clip-mask rotate.

Beat 7 — Process (horizontal scroll inside vertical)

Four steps: 'LISTEN — SKETCH — BUILD — SHIP.' Wrapping section pins; inner row translates horizontally as scroll progresses. Each step card is a poster — huge number, short label, 2-line description in Body L.

Beat 8 — Voices (slow editorial)

Two testimonial cards. Italic editorial pull-quote in Display L. Portrait photograph treated through the Wings Mediaa grade. Mono attribution row below. Soft fade-up entry, no scrubs — the page slows here on purpose.

Beat 9 — CTA close

The wordmark scales to fill the viewport at the bottom. Below it: a magnetic primary CTA ('Start a project') and a secondary calendar link. The cursor over the CTA snaps with a 0.18 coefficient over a 120px radius. Beneath: footer.
